

VistA Immunization (VIMM) will modify existing Immunization functions enabling VA to quickly and reliably document and exchange standardized immunization information on beneficiaries across services and departments. Additionally, modifications will support certification for Meaningful Use (C/MU) as well as VistA Evolution (VistA-4) requirements, to ensure readiness to meet Federated Data Accelerator goals.

Modifications will support certification for Meaningful Use (C/MU) as well as VistA Evolution (VistA-4) requirements, to ensure readiness to meet Federated Data Accelerator goals.

The Immunization project will provide a Veteran patient-centric vaccine record exchangeable with the external community. Clinicians will have access to a more complete medical history in the VistA EMR resulting in improved health status as well as public health monitoring.
